NITROGEN PURGE ALARM

NFPA-99, 2002 and 2005 editions requires that the Medical Gas Installer be notified when the contents of the Nitrogen Purge is running low.

We have searched the industry and have found a replacement high pressure gauge that does just that. All you do is remove the high pressure gauge from your existing purging rig and replace it with the LO-N₂ Alert Alarm Gauge.

The battery is only being used when the unit is in alarm or while the test button is depressed. The unit has both a visual and audible alarm when the Nitrogen pressure falls below 500 psi +/- 150 psi.

Unit is cleaned for Oxygen Service and is normally in-stock.
